## Chapter . 1

## Electric Charges and Fields <br> Class - XII <br> Subject - Physics

1.1 What is the force between two small charged spheres having charges of $2 \times 10-7$ C and $3 \times 10-7$ C placed 30 cm apart in air?

Sol.
Given:
$\mathrm{Q} 1=2 \times 10-7 \mathrm{C}$
$\mathrm{Q} 2=3 \times 10-7 \mathrm{C}$
$\mathrm{r}=30 \times 10-2 \mathrm{~m}$
We know,
$\mathrm{F}=\left(\mathrm{Q} \_1 \mathrm{Q} \_2\right) /\left(4 \pi \varepsilon \_\right.$o $\left.\mathrm{r}^{\wedge} 2\right)$
Substituting the given values, we get
$\mathrm{F}=6 \mathrm{x} 10-3 \mathrm{~N}$
2.1 The electrostatic force on a small sphere of charge 0.4 micro coulomb due to another small sphere of charge $\mathbf{- 0 . 8}$ micro coulomb in air is $\mathbf{0 . 2} \mathbf{N}$.
a) What is the distance between the two spheres?
b) What is the force on the second sphere due to the first?

## Sol.

a) From the formula

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more

## Physics Class $12{ }^{\text {th }}$ NCERT Solutions

$$
\mathrm{F}=\left(\mathrm{Q} \_1 \mathrm{Q} \_2\right) /\left(4 \pi \varepsilon \_ \text {o r}{ }^{\wedge} 2\right)
$$

Substituting the values, we get
$\mathrm{r}=0.12 \mathrm{~m}=12 \mathrm{~cm}$
b) Force on second sphere due to first
$\mathrm{F} 21=\left(\mathrm{Q} \_1 \mathrm{Q} \_2\right) /\left(4 \pi \varepsilon_{-} \mathrm{o} \mathrm{r}^{\wedge} 2\right)$
This comes to be -0.2 N , negative sign implying the attractive nature of force. This conforms to Newton's third law.

### 3.1 Check that the ratio ke2/Gmemp is dimensionless. Look up a table of

 Physical Constants and determine the value of this ratio. What does the ratio signify?Sol.
We know very well

$$
\mathrm{k}=9 \times 109 \mathrm{Nm} 2 / \mathrm{C} 2
$$

$$
e=1.6 \times 10-19 C
$$

$$
\mathrm{G}=6.6 \times 10-11 \mathrm{Nm} 2 / \mathrm{kg} 2
$$

$$
\mathrm{me}=9.11 \times 10-31 \mathrm{~kg}
$$

$\mathrm{mp}=1.6 \times 10-27 \mathrm{~kg}$

Ratio $=\left(\mathrm{Nm}^{\wedge} 2\right) / \mathrm{C}^{\wedge} 2 . \mathrm{C}^{\wedge} 2 . \llbracket \mathrm{kg} \rrbracket \wedge 2 / \llbracket \mathrm{Nm} \rrbracket \wedge 2.1 / \llbracket \mathrm{kg} \rrbracket \wedge 2=$ dimensionless

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more....

And value $=2.4 \times 1039$

The ratio signifies that electrical forces are immensely stronger than the gravitational forces.

## 4.1

a) Explain the meaning of the statement 'electric charge of a body is quantized'.
b) Why can one ignore quantization of electric charge when dealing with macroscopic, i.e., large scale charges?

## Sol.

a) Quantization is one of the three basic properties of electric charge. It means that every charge is an integral multiple of e, i.e., ne, $n=* \cdot .-2,-1,0,1,2 \ldots$ The addition of charges, subtraction of charges, being an integer always gives integer result. Thus a charge can always be incremented or decremented in terms of e.
b) Macroscopic charges have very large number of electrons. The quantization here can be taken as a continuous phenomenon, analogous to closely spaced dots resembling to line from a distance.

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more...
5.1 When a glass rod is rubbed with a silk cloth, charges appear on both. A similar phenomenon is observed with many other pairs of bodies. Explain how the observation is consistent with the law of conservation of charge.

## Sol.

When two bodies are rubbed with each other transfer of charge takes place. One body receives charge and other loses, becoming negatively and positively charged respectively. In the whole process no new charge is created or destroyed. This implies that in an isolated system the total charge is always conserved.
6.1 Four point charges $q A=2 \mu C, q B=-5 \mu C, q C=2 \mu C$, and $q D=-5 \mu C$ are located at the corners of a square $A B C D$ of side 10 cm . What is the force on a charge of $1 \mu \mathrm{C}$ placed at the centre of the square?

## Sol.

The charges of equal magnitude and same sign are at the corners of same diagonal. So they will exhibit equal and opposite forces at the charge situated at center, cancelling out each other. So the force is zero Newton.
a) An electrostatic field line is a continuous curve. That is, a field line cannot have sudden breaks. Why not?

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more...........

Simplifying Test Prep
b) Explain why two field lines never cross each other at any point?

Sol.
a) The direction of electric field is given by tangent at each point on the curve. At sudden breaks, the field will have more than one direction which is not possible. That's why electrostatic field line is a continuous curve
b) At the crossing point there will be two directions of electric field at that point given by the two tangents. This cannot happen, and so two field lines never cross each other at any point.
8.1 Two point charges $q A=3 \mu \mathrm{C}$ and $\mathrm{qB}=-3 \mu \mathrm{C}$ are located 20 cm apart in vacuum.
a) Two point charges $q \mathrm{~A}=3 \mu \mathrm{C}$ and $\mathrm{qB}=-3 \mu \mathrm{C}$ are located 20 cm apart in vacuum.
b) If a negative test charge of magnitude $1.5 \times 10-9 \mathrm{C}$ is placed at this point, what is the force experienced by the test charge?

## Sol.

a) Given:
$\mathrm{qA}=3$ microC
$\mathrm{qB}=-3$ microC
$\mathrm{r}=10 \mathrm{~cm}$ (point is in middle)

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more...........

## Physics Class $12{ }^{\text {th }}$ NCERT Solutions

We know, electric field is given by formula $\mathrm{E}=\mathrm{Q} /\left(4 \pi \epsilon \_\right.$o r^2 )

Electric field due to charge A (by use of above formula)
$\mathrm{E} 1=2.7 \times 106 \mathrm{~N} / \mathrm{C}$
Electric field due to charge B
$\mathrm{E} 2=-2.7 \times 106 \mathrm{~N} / \mathrm{C}$
Since both the fields have the same direction, the electric
field at O will be summation of above field
So E $=5.4 \times 106$ N/C
b) Given:
$\mathrm{qA}=3 \mathrm{microC}$
$q B=-3$ microC
$\mathrm{qO}=-1.5 \mathrm{nanoC}$
$\mathrm{r}=10 \mathrm{~cm}$ (point is in middle)
By the formula
$\mathrm{F}=\left(\mathrm{Q} \_1 \mathrm{Q} \_2\right)\left(4 \pi \varepsilon \_\mathrm{or}^{\wedge} 2\right)$
F1 = (3x10-6).(-1.5x10-9).(9x109) / (10x10-2)2
$=-4.05 \times 10-3 \mathrm{~N}$ (attractive)
$\mathrm{F}_{2}=+4.05 \times 10-3 \mathrm{~N}$ (repulsive)
So the net force experienced by test charge
$\mathrm{F}=\mathrm{F} 1-\mathrm{F} 2=8.1 \times 10-3 \mathrm{~N}$ towards charge A .

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more
9.1 A system has two charges $q A=2.5 \times 10-7 \mathrm{C}$ and $\mathrm{qB}=\mathbf{- 2 . 5 \times 1 0 - 7 \mathrm { C }}$ located at points A: $(0,0,-15 \mathrm{~cm})$ and $B:(0,0,+15 \mathrm{~cm})$, respectively. What are the total charge and electric dipole moment of the system?

Sol.
Total charge of electric dipole $=$ zero coulomb
Now, given
$2 \mathrm{a}=30 \mathrm{~cm}$
$\mathrm{q}=2.5 \times 10-7 \mathrm{C}$
Dipole moment, $\mathrm{p}=\mathrm{q} .2 \mathrm{a}$
$=(2.5 \times 10-7) .(30)$
$=7.5 \times 10-8 \mathrm{Cm}$
10.1 An electric dipole with dipole moment $\mathbf{4 \times 1 0 - 9} \mathbf{C ~ m}$ is aligned at $30^{\circ}$ with the direction of a uniform electric field of magnitude $5 \times 104$ $\mathrm{NC}-1$. Calculate the magnitude of the torque acting on the dipole.

Given
Dipole moment, $\mathrm{p}=4 \times 10-9 \mathrm{Cm}$
$\theta=30$
$\mathrm{E}=5 \times 104 \mathrm{~N} / \mathrm{C}$
We know
Torque $=\mathrm{p} \mathrm{E} \sin \Theta$
$=(4 \times 10-9)(5 \times 104)(\sin 30)$
$=10-4 \mathrm{Nm}$

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more.
11.1 A polythene piece rubbed with wool is found to have a negative charge of $3 \times 10-7 \mathrm{C}$.
a) Estimate the number of electrons transferred (from which to which?)
b) Is there a transfer of mass from wool to polythene?

## Sol.

Given
$q=-3 \times 10-7 C$ on polythene
a) $\mathrm{q}=\mathrm{ne}$

Since $e=1.6 \times 10-19 C$
Therefore, $\mathrm{n}=\mathrm{q} / \mathrm{e}=1.875 \times 1012$ electrons.
Electrons are transferred from wool to polythene.
b) Mass transfer = number of electrons transferred x mass of an electron

$$
=1.7 \times 10-18 \mathrm{~kg}
$$

The transfer of mass is negligible.
a) Two insulated charged copper spheres $A$ and $B$ have their centers separated by a distance of 50 cm . What is the mutual force of electrostatic repulsion if the charge on each is $6.5 \times 10-7 \mathrm{C}$ ? Theradii of A and B are negligible compared to the distance of separation.
b) What is the force of repulsion if each sphere is charged double the above amount, and the distance between them is halved?

Sol.
a) The force is given by
$\mathrm{F}=\left(\mathrm{Q} \_1 \mathrm{Q} \_2\right) /\left(4 \pi \varepsilon \_\mathrm{or}^{\wedge} 2\right)$
Substituting the values
$\mathrm{F}=[(6.5 \times 10-7) 2 .(9 \times 109)] /[50 \times 10-2] 2=0.015 \mathrm{~N}$
b) Now
$\mathrm{q}=1.3 \times 10-6 \mathrm{C}$
$\mathrm{r}=25 \mathrm{~cm}$
Using the above formula
$\mathrm{F}=0.24 \mathrm{~N}$
13.1 Suppose the spheres A and B in Exercise 1.12 have identical sizes. A third sphere of the same size but uncharged is brought in contact with the first, then brought in contact with the second, and finally removed from both. What is the new force of repulsion between $A$ and $B$ ?

Sol.

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more...........

## Physics Class $12{ }^{\text {th }}$ NCERT Solutions

Simplifying Test Prep
When an uncharged sphere is brought in contact with sphere A, half of the charge will be shifted to third sphere. So the charge q1 on sphere A becomes $3.25 \times 10-7$ C. Again on contact of sphere C with sphere $B$, redistribution of charge will happen and charge $q 2$ on sphere B gets $4.875 \times 10-7 \mathrm{C}$. Then by the same formula for force, we get
$\mathrm{F}=(9 \mathrm{x} 109) .(\mathrm{q} 1 . \mathrm{q} 2) / \mathrm{r} 2$
$=5.7 \times 10-3 \mathrm{~N}$
14.1 Figure $\mathbf{1 . 3 3}$ shows tracks of three charged particles in a uniform electrostatic field. Give the signs of the three charges. Which particle has the highest charge to mass ratio?

Sol.
Charge $1=$ negative
Charge $2=$ negative
Charge 3 = positive

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more........... Since mass of proton is more than mass of electron, charge 3 will have highest charge to mass ratio.
15.1 Consider a uniform electric field $\mathbf{E}=3 \times 103 \mathrm{î} \mathrm{N} / \mathrm{C}$.
a) What is the flux of this field through a square $\mathbf{~} \mathbf{1 0} \mathbf{~ c m}$ on a side whose plane is parallel to the yz plane?
b) What is the flux through the same square if the normal to its plane makes a $60^{\circ}$ angle with the $x$-axis?

Sol.
Given:
$\mathrm{E}=3000 \mathrm{~N} / \mathrm{C}$
$\mathrm{a}=10 \mathrm{~cm}$
a) Flux $=\mathrm{E} . \Delta \mathrm{S}=3000 \times 100 \times 1 / 10000=30 \mathrm{Nm} 2 / \mathrm{C}$
b) Flux $=\mathrm{E} \cdot \Delta \mathrm{S} \cdot \cos 30=25.98 \mathrm{Nm} 2 / \mathrm{C}$
16.1 What is the net flux of the uniform electric field of Exercise $\mathbf{1 . 1 5}$ through a cube of side 20 cm oriented so that its faces are parallel to the coordinate lanes?

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more.

Sol.
Zero. All the flux entering will leave the cube.
17.1 Careful measurement of the electric field at the surface of a black box indicates that the net outward flux through the surface of the box is $8.0 \times 103 \mathrm{Nm} 2 / \mathrm{C}$.
a) What is the net charge inside the box?
b) If the net outward flux through the surface of the box were zero, could you conclude that there were no charges inside the box? Why or Why not?
Sol.
Given:
Outward flux $=8 \times 103 \mathrm{Nm} 2 / \mathrm{C}$
a) We know, flux, $\varnothing=q / \epsilon \_$o

So, net charge $\mathrm{q}=(8 \times 103) .(8.85 \times 10-12)=7 \times 10-8 \mathrm{C}$
b) No. The net charge is zero inside the box
18.1 A point charge $+10 \times 10-6 \mathrm{C}$ is a distance 5 cm directly above the centreof a square of side 10 cm , as shown in Fig. 1.34. What is the magnitude of the electric flux through the square? (Hint: Think of the square as one face of a cube with edge 10 cm .)

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more...........

## Physics Class $12^{\text {th }}$ NCERT Solutions

Sol.
Given in the question:
$\mathrm{q}=10 \times 10-6 \mathrm{C}$
$\mathrm{a}=10 \mathrm{~cm}$
Considering the charge at the center of the imagined cube of dimension 10 cm , the flux can be calculated from the formula $\phi=q / \epsilon_{-} \mathrm{O}$
$=(10 \times 10-6) /(8.85 \times 10-12)$
$=1.12 \times 106 \mathrm{Nm} 2 / \mathrm{C}$

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more...........
19.1 A point charge of $2.0 \times 10-6 \mathrm{C}$ is at the centre of a cubic Gaussian surface 9.0 cm on edge. What is the net electric flux through the surface?

Sol.
Using the same formula used in previous question

$$
\begin{aligned}
\text { flux } & =(2 \times 10-6) /(8.85 \times 10-12) \\
& =2.2 \times 105 \mathrm{Nm}^{2} / \mathrm{C}
\end{aligned}
$$

20.1 20A point charge causes an electric flux of $-1.0 \times 103 \mathrm{Nm} 2 / \mathrm{C}$ to pass through a spherical Gaussian surface of 10.0 cm radius centere on the charge.
a) If the radius of the Gaussian surface were doubled, how much flux would pass through the surface?
b) What is the value of the point charge?

Sol.
Given:
flux $=103 \mathrm{Nm} 2 / \mathrm{C}$
a) Same flux will pass through the surface. It does not depend upon the dimension of Gaussian surface.
b) From the formula

$$
\phi=q / \epsilon \_0
$$

Charge $q=(-1000) \cdot(8.85 \times 10-12)=-8.8 \times 10-9 C$

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more
21.1 A conducting sphere of radius 10 cm has an unknown charge. If the electric field 20 cm from the centre of the sphere is $1.5 \times 103 \mathrm{~N} / \mathrm{C}$ and points radically inward, what is the net charge on the sphere?

Sol.

Given:
$\mathrm{E}=1500 \mathrm{~N} / \mathrm{C}$
$\mathrm{r}=20 \mathrm{~cm}$
By the formula
$\mathrm{E}=\mathrm{Q} /\left(4 \pi \mathrm{c}_{\mathrm{o}} \mathrm{or}^{\wedge} 2\right.$ )
$\mathrm{Q}=[(1500) .(20 \times 10-2) 2] /[9 \times 109]$
$=-6.67 \mathrm{x} 10-19 \mathrm{C}$
Negative charge is due to the inward direction of electric field, implying the concerned charge is negative
22.1 A uniformly charged conducting sphere of $\mathbf{2 . 4} \mathbf{m}$ diameter has a surface charge density of $80.0 \times 10-6 \mathrm{C} / \mathrm{m} 2$
a) Find the charge on the sphere.
b) What is the total electric flux leaving the surface of the sphere?

Sol.
Given in the question:

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more.

Surface charge density $\sigma=80 \times 10-6 \mathrm{C} / \mathrm{m} 2$
$\mathrm{R}=1.2 \mathrm{~m}$
a) Using the formula
$\mathrm{Q}=4 \pi \mathrm{R}^{\wedge} 2 \sigma$
Substituting the values
$\mathrm{Q}=1.45 \times 10-3 \mathrm{C}$
b) By the formula

$$
\begin{aligned}
& \mathrm{E}=\left(\sigma \mathrm{R}^{\wedge} 2\right) /\left(\epsilon \_ \text {or } \mathrm{r}^{\wedge} 2\right) \\
& \text { or } \mathrm{E}=(80 \times 10-6) /(8.85 \times 10-12)=9 \times 106 \mathrm{~N} / \mathrm{C}
\end{aligned}
$$

Total electric flux $=$ E. $4 \pi \mathrm{R}^{\wedge} 2=(9 \mathrm{x} 106) .(4) .(3.14) .(1.2 \times 1.2)$
$=1.6 \times 108 \mathrm{Nm}^{2} / \mathrm{C}$
23.1 An infinite line charge produces a field of $9 \times 104 \mathrm{~N} / \mathrm{C}$ at a distance of $\mathbf{2} \mathbf{~ c m}$. Calculate the linear charge density.

Sol.
Given:
$\mathrm{E}=90000 \mathrm{~N} / \mathrm{C}$
$\mathrm{r}=2 \mathrm{~cm}$
Linear charge density $=$ E. $2 \pi \in \mathrm{r}$
$=(90000) \cdot(2 \times 3 \cdot 14) \cdot(8 \cdot 85 \times 10-12) \cdot(2 \times 10-2)$
$=10-7 \mathrm{C} / \mathrm{m}$

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more...........
24.1 Two large, thin metal plates are parallel and close to each other. On their inner faces, the plates have surface charge densities of opposite signs and of magnitude $17.0 \times 10-22 \mathrm{C} / \mathrm{m} 2$. What is E :
a) in the outer region of the first plate
b) in the outer region of the second plate, and
c) Between the plates?

Sol.
Given:
Surface charge density $=17 \times 10-22 \mathrm{C} / \mathrm{m} 2$
a) Zero, as the field due to both plates will cancel out each other.
b) Zero, with the above reason.
c) E due to plate 1
$\mathrm{E} 1=\sigma / 2 \mathrm{\epsilon O}$
$=17 \times 10-22 / 2 \times 8.85 \times 10-12$
$=9.6 \times 10-11 \mathrm{~N} / \mathrm{C}$
Similarly $\quad E 2=9.6 \times 10-11 \mathrm{~N} / \mathrm{C}$
E1 will have outward direction towards plate 2, while E2 will have inward direction towards plate 2 . So both the fields add up
Thus

$$
\mathrm{E}=\mathrm{E} 1+\mathrm{E} 2
$$

Get SOLVED \& UNSOLVED question papers, updated Syllabus, Sample papers, Practice papers and study material for the and much more...........

$$
\mathrm{E}=1.9 \times 10-10 \mathrm{~N} / \mathrm{C}
